1 Statistics

In the statistics module we analyze data for different responses and at different spectral peak locations. We use Python package scipy in this module.

1.1 T-Test

T-test checks for difference in the mean between two sample from different responses. We assume the data is independent and follows the normality assumption. Let $x_1, \ldots, x_n$ and $y_1, \ldots, y_m$ be the two samples and we test whether the means are equal. The null hypothesis states means μ_1 and μ_2 are equal and the alternative hypothesis states they are not equal. If the p-value is lower than the chosen significance level, we can reject the null hypothesis, i.e. the samples do not have the same means.

[1]:
```
        import modules.adapml_data as adapml_data
        import modules.adapml_classification as adapml_classification
        import modules.adapml_clustering as adapml_clustering
        import modules.adapml_chemometrics as adapml_chemometrics
        import modules.adapml_statistics as adapml_statistics
        import modules.adapml_regression as adapml_regression
        import numpy as np
        import modules.loadTestData as load_data
        import sklearn.preprocessing as pre
        from sklearn.cross_decomposition import PLSRegression as PLS
        from matplotlib import pyplot as plt
        from sklearn import cluster as clst
        from scipy.cluster.hierarchy import dendrogram

        import os

        reldir = os.getcwd()
        path_to_data = os.path.join(reldir, '..', 'data',␣
↪'SCLC_study_output_filtered_2.csv')

        data = adapml_data.DataImport(path_to_data)

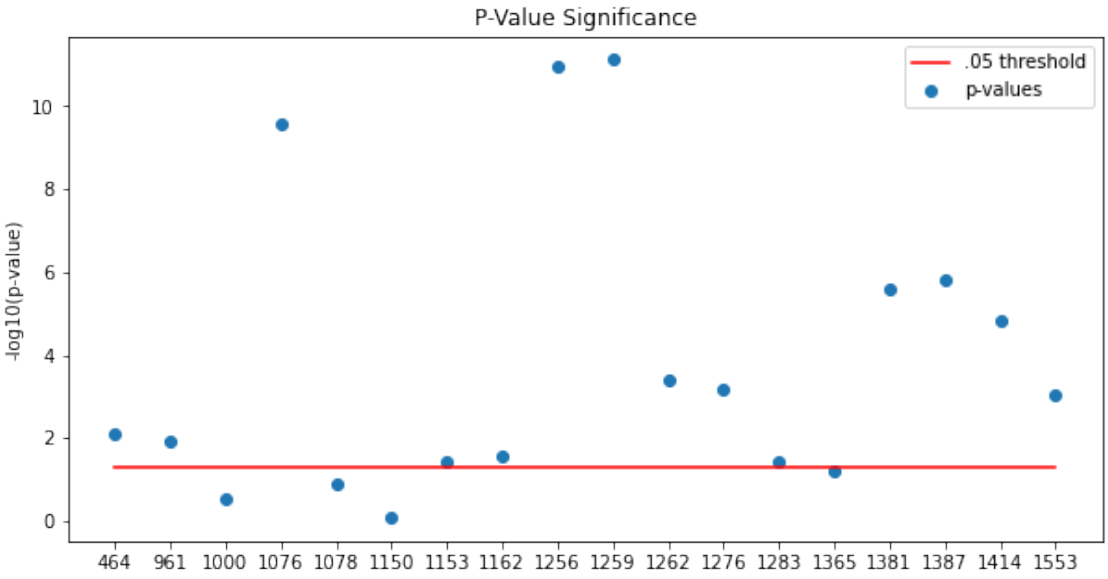
        response1D = data.resp
        #response1D = adapml_data.DataImport.getResponse(path_to_data)
```

```
        response2D = adapml_data.DataImport.getDummyResponse(response1D)

        variables = data.getVariableNames()
        samples = data.getSampleNames()

        t_test = adapml_statistics.Statistics(data.data, 'anova', response1D)
        t_test.plot_logp_values(variables)
```

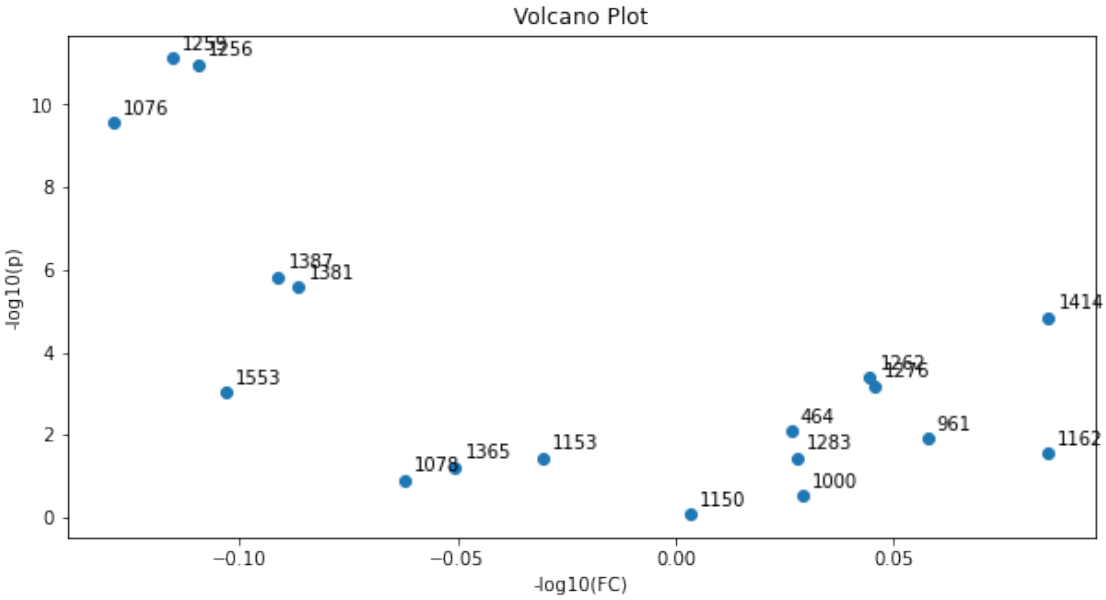
18
18



1.2 Volcano Plot

Volcano plot is a scatter plot which demonstrates magnitude between the responses and t-test significance of the data. We can choose a significance level and fold change limit to specify the rectangle of interest.

[2]:
```
t_test.plot_volcano_t(variables)
```



1.3 Multiple Hypotheses Testing Correction

The family wise error (FWER) is defined as the probability of yielding one or more false positives out of all hypotheses tested. When the number of hypotheses tested incrases, so does the FWER, if the significance level is kept constant. In multiple hypotheses testing, this can be controlled by the Bonferroni correction.

In multiple testing we can also control for the proportion of false discoveries among the discoveries. This is done by adjusting the false discovery rate and one of the methods for controlling it is the Benjamini-Hochberg method.

[3]:
```
print("The significance level after the Bonferroni correction with FWER=0.05 is␣
 ↪" + str(t_test.Bon1))
print("The significance level after the Bonferroni correction with FWER=0.01 is␣
 ↪" + str(t_test.Bon2))
print("The Benjamini-Hochberg correction at the FDR level 0.05 is " +␣
 ↪str(t_test.BH1))
print("The Benjamini-Hochberg correction at the FDR level 0.01 is " +␣
 ↪str(t_test.BH2))
```

```
The significance level after the Bonferroni correction with FWER=0.05 is 0.0025
The significance level after the Bonferroni correction with FWER=0.01 is 0.0005
The Benjamini-Hochberg correction at the FDR level 0.05 is 0.028302359978919844
The Benjamini-Hochberg correction at the FDR level 0.01 is 0.0009531814350754048
```

2 Dimension-Reduction

Dimension-reduction methods are used to condense high dimensional data down to dimensions which provide the most information. We have implemented the principal component analysis (PCA). It performs a change of basis and the new basis is chosen, such that the i-th principal component is orthogonal to the first i-1 principal components and the direction maximizes the variance of the projected data. We use the Python library sklearn.

2.1 Principal Component Analysis

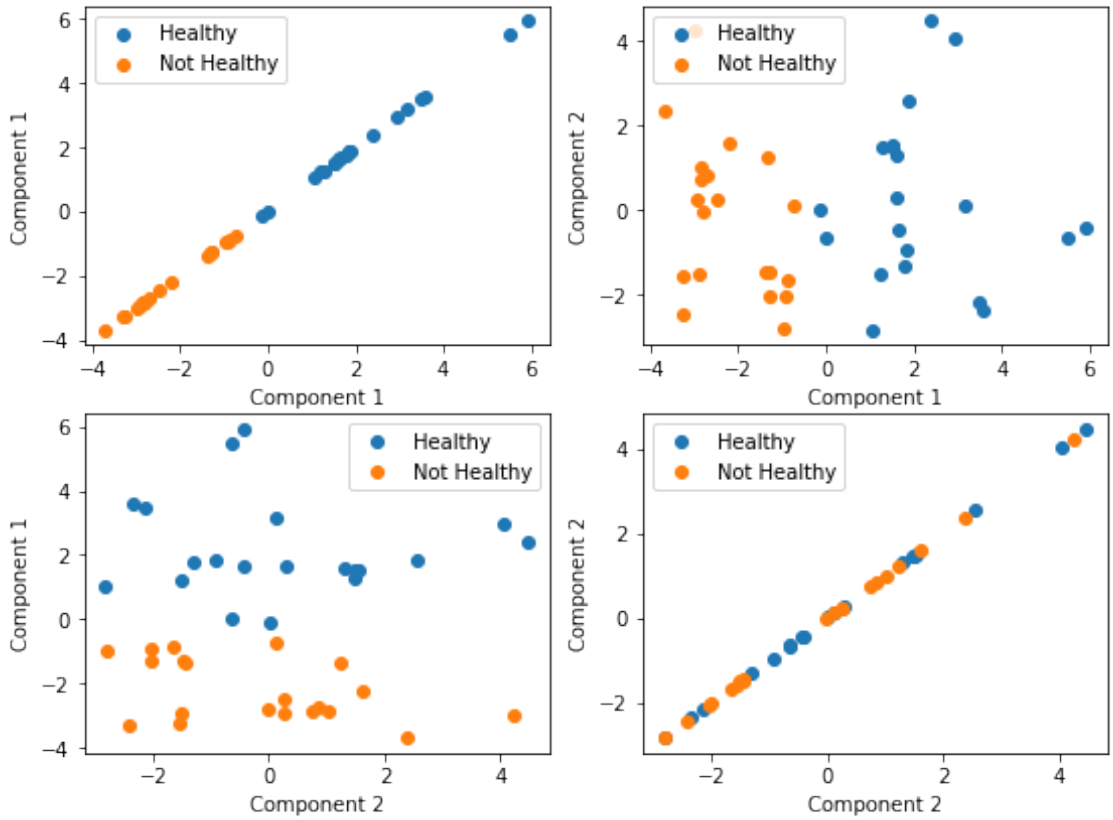
The principal component analysis (PCA) is one of the methods for dimension-reduction. It performs a change of basis and the new basis is chosen, such that the i-th principal component is orthogonal to the first i-1 principal components and the direction maximizes the variance of the projected data. Instead of considering all the dimensions, we pick the necessary number of principal components.

[4]:
```
data.normalizeData("autoscale")

pca = adapml_chemometrics.Chemometrics(data.data, "pca", response1D)

print("PCA Projections");pca.plotProjectionScatterMultiClass(2,␣
 ↪labels=["Healthy", "Not Healthy"])
```

```
PCA Projections
Projections of data into latent space.
Data is colored by response
```



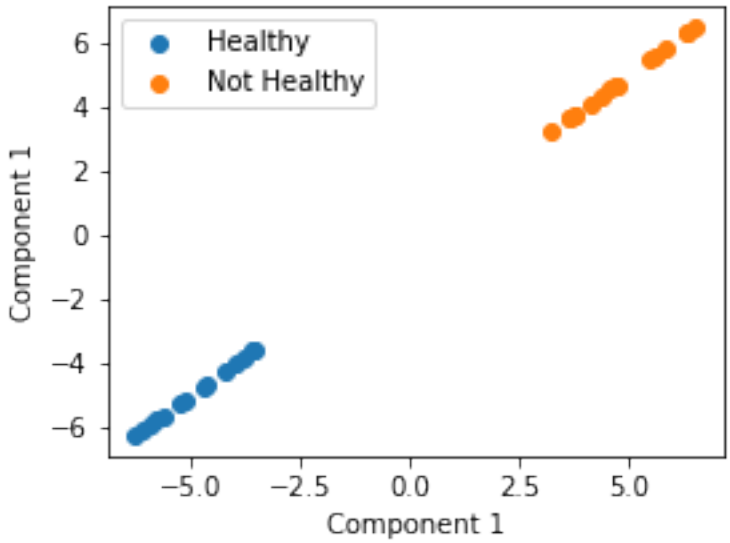
2.2 Linear Discriminant Analysis

Linear discriminant analysis is a classifier with a linear decision boundary. We assume normality and fit conditional densities $p(x \mid y = 0)$ and $p(x \mid y = 1)$ with mean and covariance parameters (μ_0, σ_0) and (μ_1, σ_1), where x, μ_0 and μ_1 are vectors. Dimensionality-reduction is done by projecting the input to the most discriminative directions.

[5]:
```
lda = adapml_chemometrics.Chemometrics(data.data, "lda", response1D) # Also␣
↪Predicts

print("LDA Projections");lda.plotProjectionScatterMultiClass(1,␣
↪labels=["Healthy", "Not Healthy"])
```

```
LDA Projections
Projections of data into latent space.
Data is colored by response
```



3 Clustering

In this module we use various different clustering methods on spectra. We use the elbow method to find the optimal number of clusters. Clustering is done with scipy and sklearn libraries.

[6]:
```
silhouette = adapml_clustering.Clustering(data.data, 'silhouette', 3)
nr_clusters = silhouette.clustnr
```

3.1 K-Means Clustering

K-means clustering aims to partition the data into k sets and to minimize the Euclidian within-cluster sum of squares (WCSS). It is solved by either Lloyd's or Elkan's algorithm and we use sklearn module in Python.

[7]:
```
kmeans_cluster = adapml_clustering.Clustering(data.data, 'kmeans', nr_clusters)
kmeans_cluster.getClusterResults(samples)
```

	Cluster 1	Cluster 2
0	SCLC_86M1_2	NSCLC_A549_1
1	SCLC_86M1_1	NSCLC_H1703_2
2	SCLC_16HV_1	NSCLC_H1703_1
3	SCLC_16HV_2	NSCLC_A549_2
4	SCLC_DMS79_1	NSCLC_H1437_1
5	SCLC_DMS79_2	NSCLC_H2228_1
6	SCLC_H187_2	NSCLC_H2228_2
7	SCLC_H187_1	NSCLC_H1437_2
8	SCLC_H209_1	NSCLC_H3122_1
9	SCLC_H524_1	NSCLC_H322_2
10	SCLC_H209_2	NSCLC_H322_1
11	SCLC_H524_2	NSCLC_H358_2
12	SCLC_H69_1	NSCLC_H3122_2
13	SCLC_H82_1	NSCLC_H522_1
14	SCLC_H82_2	NSCLC_H522_2
15	SCLC_H69_2	NSCLC_HCC4006_1
16	SCLC_N417_2	NSCLC_H358_1
17	SCLC_N417_1	NSCLC_PC9_1
18	SCLC_SW210-5_1	NSCLC_PC9_2
19	SCLC_SW210_5_2	NSCLC_HCC4006_2

3.2 BIRCH Clustering

BIRCH (balance iterative reducing and clustering using hierarchies) is a hierarchical clustering method. The hierarchy is created based on the linear sum and the square sum of data points.

[8]:
```
birch_cluster = adapml_clustering.Clustering(data.data, 'birch', nr_clusters)
birch_cluster.getClusterResults(samples)
```

	Cluster 1	Cluster 2
0	NSCLC_A549_1	SCLC_86M1_2
1	NSCLC_H1703_2	SCLC_86M1_1
2	NSCLC_H1703_1	SCLC_16HV_1
3	NSCLC_A549_2	SCLC_16HV_2
4	NSCLC_H1437_1	SCLC_DMS79_1
5	NSCLC_H2228_1	SCLC_DMS79_2
6	NSCLC_H2228_2	SCLC_H187_2
7	NSCLC_H1437_2	SCLC_H187_1
8	NSCLC_H3122_1	SCLC_H209_1

9	NSCLC_H322_2	SCLC_H524_1
10	NSCLC_H322_1	SCLC_H209_2
11	NSCLC_H358_2	SCLC_H524_2
12	NSCLC_H3122_2	SCLC_H69_1
13	NSCLC_H522_1	SCLC_H82_1
14	NSCLC_H522_2	SCLC_H82_2
15	NSCLC_HCC4006_1	SCLC_H69_2
16	NSCLC_H358_1	SCLC_N417_2
17	NSCLC_PC9_1	SCLC_N417_1
18	NSCLC_PC9_2	SCLC_SW210-5_1
19	NSCLC_HCC4006_2	SCLC_SW210_5_2

3.3 DBSCAN Clustering

DBSCAN is a non-parametric density-based clustering algorithm. It clusters together nearby neighbors, marking further away points as outliers, as they are in the low density area.

[9]:
```
dbscan_cluster = adapml_clustering.Clustering(data.data, 'dbscan', nr_clusters)
dbscan_cluster.getClusterResults(samples)
```

	Cluster 1	Cluster 2
0	NSCLC_A549_1	NSCLC_H1703_2
1	NSCLC_A549_2	NSCLC_H1703_1
2	NSCLC_H1437_1	NaN
3	NSCLC_H2228_1	NaN
4	NSCLC_H2228_2	NaN
5	NSCLC_H1437_2	NaN
6	NSCLC_H322_2	NaN
7	NSCLC_H322_1	NaN
8	NSCLC_H522_1	NaN
9	NSCLC_H522_2	NaN
10	NSCLC_HCC4006_1	NaN
11	NSCLC_PC9_1	NaN
12	NSCLC_PC9_2	NaN
13	NSCLC_HCC4006_2	NaN
14	SCLC_86M1_2	NaN
15	SCLC_86M1_1	NaN
16	SCLC_16HV_1	NaN
17	SCLC_16HV_2	NaN
18	SCLC_DMS79_1	NaN
19	SCLC_DMS79_2	NaN
20	SCLC_H187_2	NaN
21	SCLC_H187_1	NaN
22	SCLC_H209_1	NaN
23	SCLC_H524_1	NaN
24	SCLC_H209_2	NaN
25	SCLC_H69_1	NaN
26	SCLC_H82_1	NaN

```
27       SCLC_H82_2            NaN
28       SCLC_H69_2            NaN
29      SCLC_N417_2            NaN
30      SCLC_N417_1            NaN
31   SCLC_SW210-5_1            NaN
32   SCLC_SW210_5_2            NaN
```

3.4 Mean Shift Clustering

The mean shift algorithm is a nonparametric clustering technique which does not require prior knowledge of the number of clusters, and does not constrain the shape of the clusters. It works by starting at data points and iteratevely finding the convergence points for kernel estimate gradient.

[10]:
```
meanshift_cluster = adapml_clustering.Clustering(data.data, 'meanshift',␣
↪nr_clusters)
meanshift_cluster.getClusterResults(samples)
```

```
          Cluster 1      Cluster 2
0      NSCLC_A549_1  NSCLC_H1703_2
1      NSCLC_A549_2  NSCLC_H1703_1
2     NSCLC_H1437_1            NaN
3     NSCLC_H2228_1            NaN
4     NSCLC_H2228_2            NaN
5     NSCLC_H1437_2            NaN
6     NSCLC_H3122_1            NaN
7      NSCLC_H322_2            NaN
8      NSCLC_H322_1            NaN
9      NSCLC_H358_2            NaN
10    NSCLC_H3122_2            NaN
11     NSCLC_H522_1            NaN
12     NSCLC_H522_2            NaN
13  NSCLC_HCC4006_1            NaN
14     NSCLC_H358_1            NaN
15      NSCLC_PC9_1            NaN
16      NSCLC_PC9_2            NaN
17  NSCLC_HCC4006_2            NaN
18      SCLC_86M1_2            NaN
19      SCLC_86M1_1            NaN
20      SCLC_16HV_1            NaN
21      SCLC_16HV_2            NaN
22     SCLC_DMS79_1            NaN
23     SCLC_DMS79_2            NaN
24      SCLC_H187_2            NaN
25      SCLC_H187_1            NaN
26      SCLC_H209_1            NaN
27      SCLC_H524_1            NaN
28      SCLC_H209_2            NaN
29      SCLC_H524_2            NaN
```

30	SCLC_H69_1	NaN
31	SCLC_H82_1	NaN
32	SCLC_H82_2	NaN
33	SCLC_H69_2	NaN
34	SCLC_N417_2	NaN
35	SCLC_N417_1	NaN
36	SCLC_SW210-5_1	NaN
37	SCLC_SW210_5_2	NaN

3.5 Gaussian Mixture Clustering

Gaussian mixture models (GMMs) cluster the data by fitting a mixture of Gaussian models to the data and clustering together data points with similar parameter estimates. It's closely related to k-means clustering but allows for less restrictive cluster shapes. K-means fits a multi-dimensional ball as the perimeter, but GMMs can also fit ellipsoidal shapes and other shapes.

[11]:
```
gaussian_cluster = adapml_clustering.Clustering(data.data, 'gaussian',␣
↪nr_clusters)
gaussian_cluster.getClusterResults(samples)
```

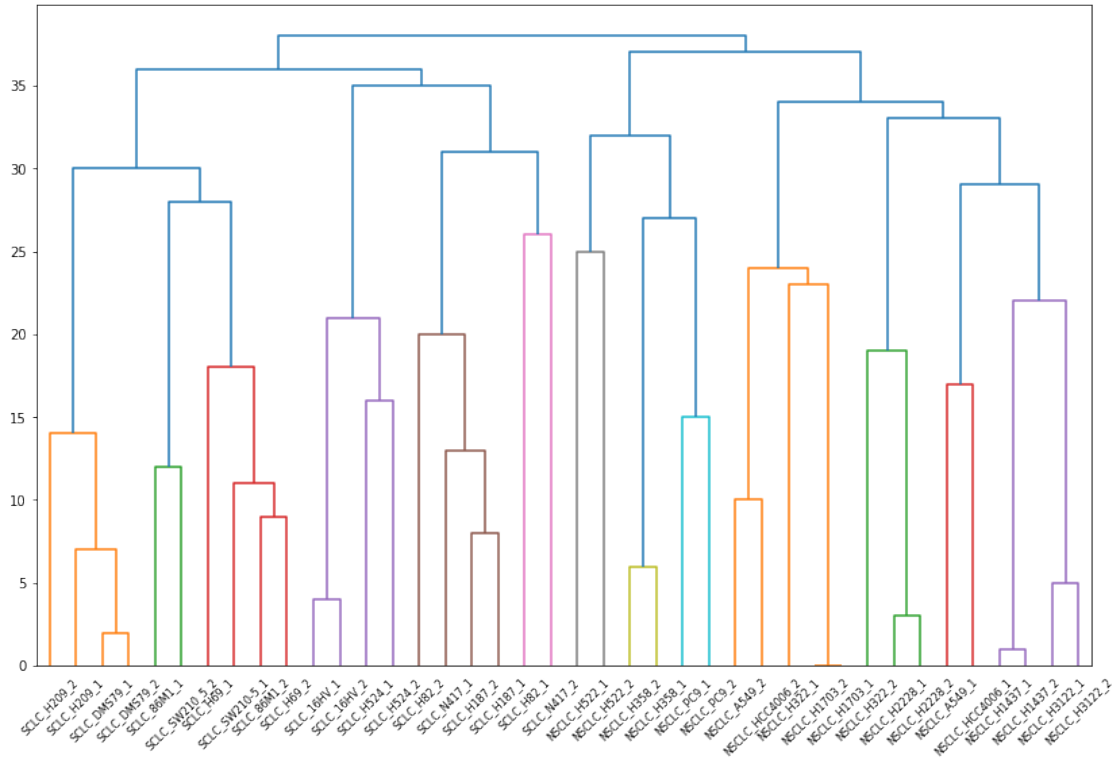
	Cluster 1	Cluster 2
0	NSCLC_A549_1	NSCLC_H522_1
1	NSCLC_H1703_2	NSCLC_H522_2
2	NSCLC_H1703_1	SCLC_86M1_2
3	NSCLC_A549_2	SCLC_86M1_1
4	NSCLC_H1437_1	SCLC_16HV_1
5	NSCLC_H2228_1	SCLC_16HV_2
6	NSCLC_H2228_2	SCLC_DMS79_1
7	NSCLC_H1437_2	SCLC_DMS79_2
8	NSCLC_H3122_1	SCLC_H187_2
9	NSCLC_H322_2	SCLC_H187_1
10	NSCLC_H322_1	SCLC_H209_1
11	NSCLC_H358_2	SCLC_H524_1
12	NSCLC_H3122_2	SCLC_H209_2
13	NSCLC_HCC4006_1	SCLC_H524_2
14	NSCLC_H358_1	SCLC_H69_1
15	NSCLC_PC9_1	SCLC_H82_1
16	NSCLC_PC9_2	SCLC_H82_2
17	NSCLC_HCC4006_2	SCLC_H69_2
18	NaN	SCLC_N417_2
19	NaN	SCLC_N417_1
20	NaN	SCLC_SW210-5_1
21	NaN	SCLC_SW210_5_2

3.6 Hierarchical Clustering

Hierarchical clustering builds hierarchies of clusters based on a chosen metric and a linkage scheme. We used cosine distance and average linkage scheme.

[12]:
```
hierarchical_cluster = adapml_clustering.Clustering(data.data, 'hierarchical',␣
↪nr_clusters)
hierarchical_cluster.getClusterResults(samples)
hierarchical_cluster.plot_dendrogram(samples)
```

	Cluster 1	Cluster 2
0	NSCLC_A549_1	SCLC_86M1_2
1	NSCLC_H1703_2	SCLC_86M1_1
2	NSCLC_H1703_1	SCLC_16HV_1
3	NSCLC_A549_2	SCLC_16HV_2
4	NSCLC_H1437_1	SCLC_DMS79_1
5	NSCLC_H2228_1	SCLC_DMS79_2
6	NSCLC_H2228_2	SCLC_H187_2
7	NSCLC_H1437_2	SCLC_H187_1
8	NSCLC_H3122_1	SCLC_H209_1
9	NSCLC_H322_2	SCLC_H524_1
10	NSCLC_H322_1	SCLC_H209_2
11	NSCLC_H358_2	SCLC_H524_2
12	NSCLC_H3122_2	SCLC_H69_1
13	NSCLC_H522_1	SCLC_H82_1
14	NSCLC_H522_2	SCLC_H82_2
15	NSCLC_HCC4006_1	SCLC_H69_2
16	NSCLC_H358_1	SCLC_N417_2
17	NSCLC_PC9_1	SCLC_N417_1
18	NSCLC_PC9_2	SCLC_SW210-5_1
19	NSCLC_HCC4006_2	SCLC_SW210_5_2



3.7 Clustering Methods Performance Evaluation

[13]:
```
kmeans_cluster.eval()
```

```
The silhouette scores for different number of clusters:
2 clusters score is 0.1500173252893647
3 clusters score is 0.11264309352667097
4 clusters score is 0.004175311164597378
5 clusters score is 0.03297732439388623
6 clusters score is -0.019362679226949054
7 clusters score is 0.024111531634731044
8 clusters score is -0.0287096698044502
9 clusters score is -0.0008852292750983704
The optimal number of clusters based on k-clustering and the silhouette scores
is 2

Error sum of squares (SSE) for different methods:
K-means SSE score is 6.5319207971311

Between groups sum of squares (SSB) for different methods:
K-means SSB score is 100.2101930956055
```

4 Classification

Classification methods aim to classify the response of samples. The given data is separated into a training set and a testing set. The model parameters are found from the training set and the testing set is used to quantify the model accuracy. The methods are from sklearn package.

4.1 Partial Least Squares-Discriminant Analysis

[14]:
```
def plotProjectionScatterMultiClass(pc, resp, num_var):
    plt.figure(figsize=(24, 18))

    for i in range(num_var):
        for j in range(num_var):
            plt.subplot(5,5,5*(i) + j + 1)
            for c in range(resp.shape[1]):
                inx = np.where(resp[:,c] == 1)[0]
                tmp = pc[inx,:]
                pc1 = tmp[:,i]
                pc2 = tmp[:,j]
                plt.scatter(pc1, pc2)
            plt.xlabel("PLS Component "+str(i+1))
            plt.ylabel("PLS Component "+str(j+1))

    plt.show()

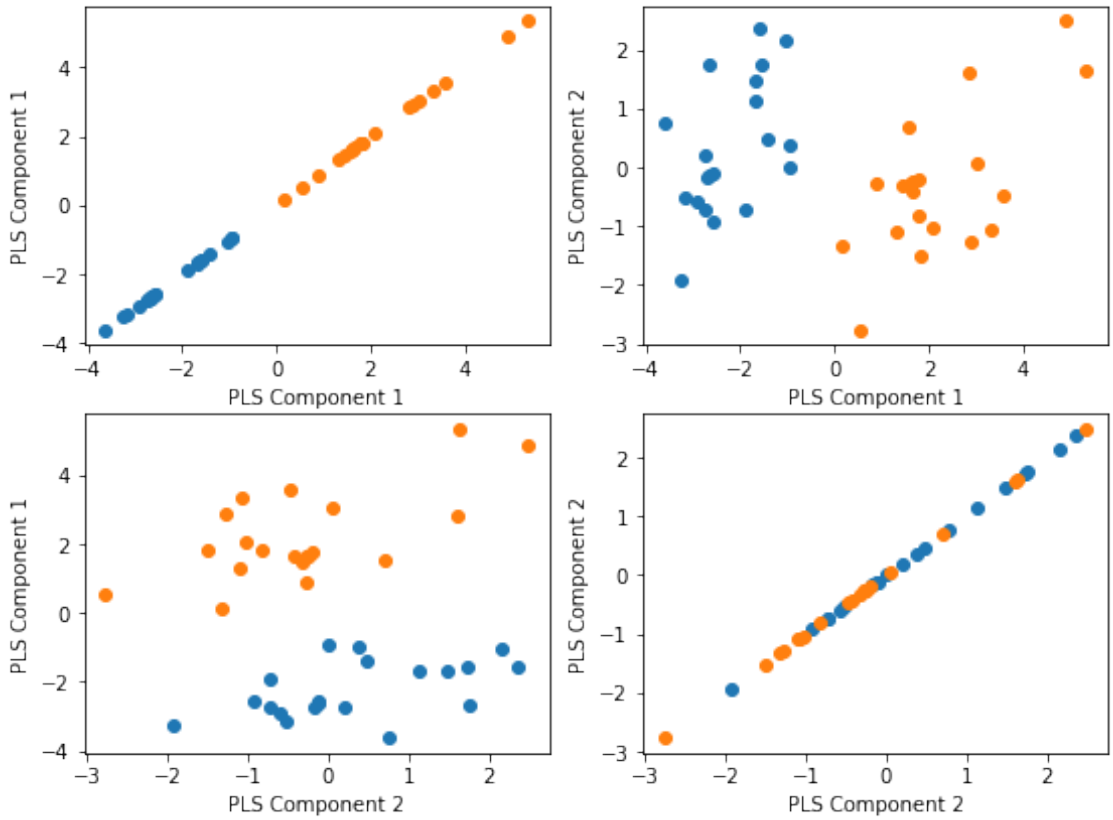
data = load_data.loadDataPandas(path_to_data)
d = data.to_numpy()
var_index = data.columns.values.tolist()

resp = load_data.getResponseMatrix2D()

norm_trans = pre.StandardScaler().fit(d)
data_norm = norm_trans.transform(d)
#data_norm, norm_trans = pre.mean_center(d)
#In-built preprocessing method - TBD

pls = PLS().fit(data_norm, resp)
pls_trans = pls.transform(data_norm)

plotProjectionScatterMultiClass(pls_trans, resp, 2)
```



4.2 Neural Network

[15]:
```
data = adapml_data.DataImport(path_to_data)
nn = adapml_classification.Classification(data.data, response1D, 'neuralnet', .
↪75, kfolds=3)

adapml_classification.print_model_stats(nn, "neuralnet")
```

```
MLP Validated Parameters:  {'activation': 'logistic', 'learning_rate':
'adaptive', 'momentum': 0.99, 'solver': 'sgd'}
neuralnet: R^2=1.0 Q^2=1.0
```

4.3 Support Vector Machines

Classification via SVM is done by fitting a linear plane to the latent space but only considering a subset of inputs in the fitting process. The quantity R^2 measures what percentage of variation was explained by the model in the training set. The quantity Q^2 shows the same measurement but for the test data set.

[16]:
```
```

```
data = adapml_data.DataImport(path_to_data)
svm = adapml_classification.Classification(data.data, response1D, 'svm', .75,␣
↪kfolds=3)

adapml_classification.print_model_stats(svm, "SVM")
```

```
SVM Validated Parameters:  {'kernel': 'linear', 'shrinking': True}
SVM: R^2=1.0 Q^2=1.0
```

4.4 Random Forest

Random forests is an ensemble classification method. It works by constructing multiple decision trees based on the training data and then choosing the class, chosen by the most number of decision trees. The quantity R^2 measures what percentage of variation was explained by the model in the training set. The quantity Q^2 shows the same measurement but for the test data set.

[17]:
```
data = adapml_data.DataImport(path_to_data)
rnf = adapml_classification.Classification(data.data, response1D,␣
↪'randomforest', .75, kfolds=3)

adapml_classification.print_model_stats(rnf, "RF")
```

```
Random Forest Validated Parameters:  {'criterion': 'gini', 'n_estimators': 10}
RF: R^2=1.0 Q^2=1.0
```

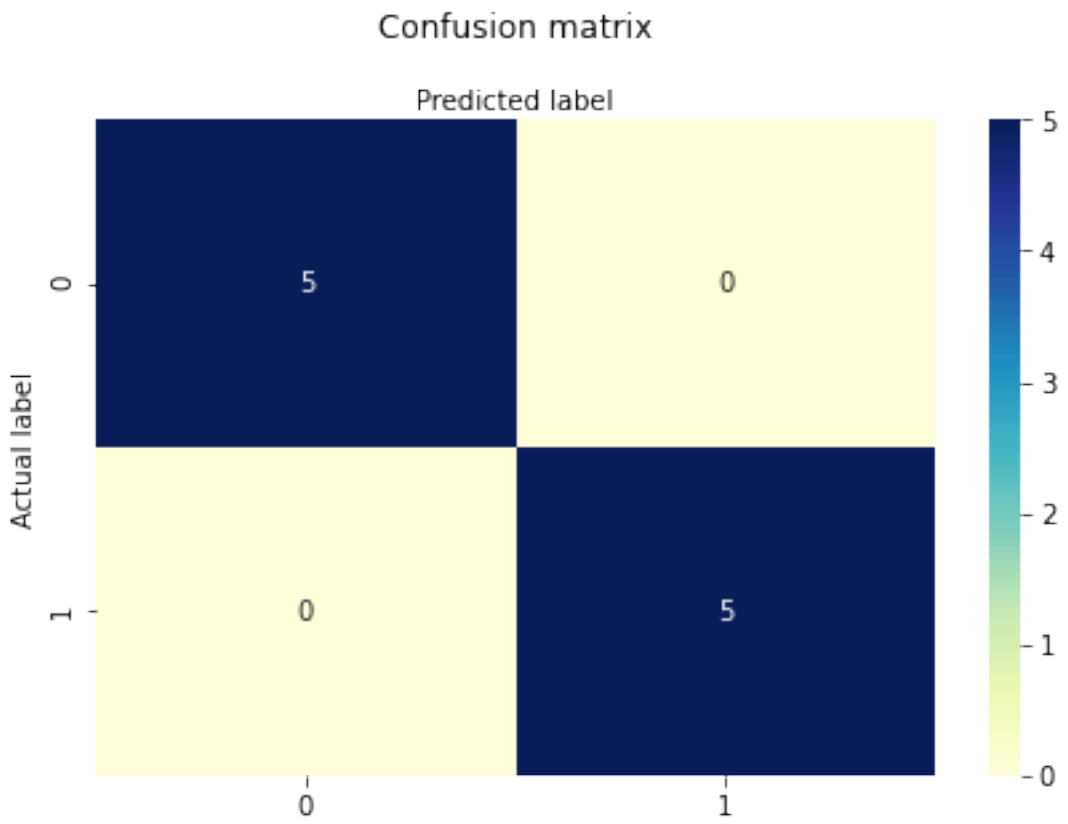
4.5 Logistic Regression

Logistic regression uses a logistic function to model a binary dependent variable. The confusion matrix displays the accuracy of the model for the test data set. We use the packages sklearn for the logistic regression and seaborn for the confusion matrix.

[18]:
```
data = adapml_data.DataImport(path_to_data)

logistic = adapml_classification.Classification(data.data, response1D,␣
↪'logistic', .25)
print(logistic)
```

```
Accuracy: 1.0
<modules.adapml_classification.Classification object at 0x133233ca0>
```

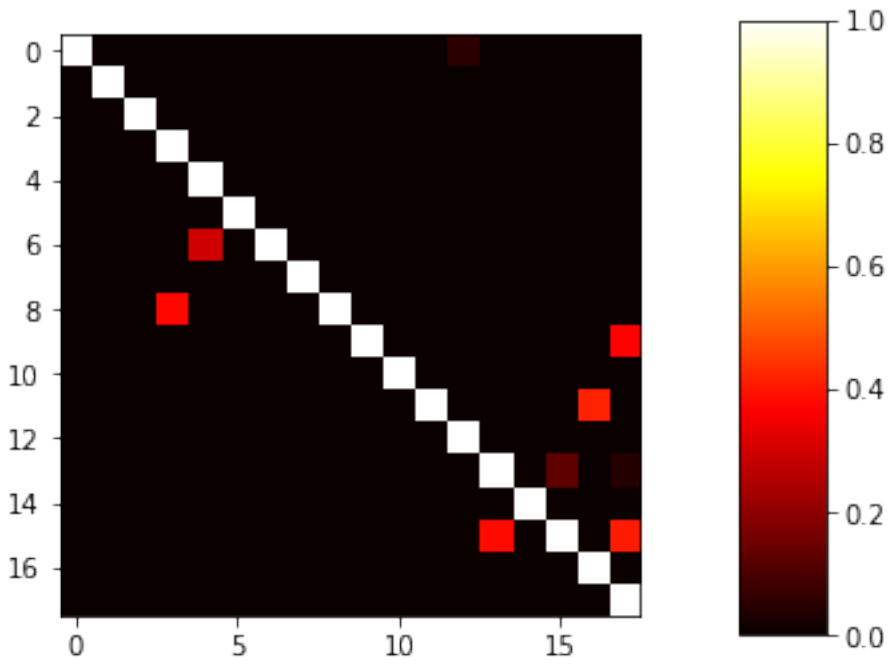


5 Regression

5.1 Linear Regression

Linear regression fits a linear plane between the dependant variables and the response. The linear plane models the relationship between them and allows for prediction or explain variation.

[19]:
```
reg = adapml_regression.Regression(data.data, "linear", 0.25)
reg.linear
reg.DisplaySampleNames(data.getSampleNames())
```



```
R2 score between NSCLC_A549_2 and NSCLC_H3122_1 is 0.37739250415156134
R2 score between NSCLC_H1437_1 and NSCLC_H2228_2 is 0.29329760536722105
R2 score between NSCLC_H522_1 and NSCLC_HCC4006_1 is 0.38171401707539343
R2 score between NSCLC_H358_1 and NSCLC_H358_2 is 0.4156127581178537
R2 score between NSCLC_PC9_1 and NSCLC_H322_2 is 0.3677940179661904
R2 score between NSCLC_PC9_1 and NSCLC_HCC4006_1 is 0.40681273290339537
